La Pedregosa • Mérida, Venezuela 5101 • rahoyo@outlook.com • +58 412 6268761

Education

Los Andes University
Venezuela

System Engineer
Date: Undergraduate

Mérida,

Graduation

Experience

Pretty Technical
LTD
Senior Frontend
Developer

Remote
Jan, 2025– Present

- Create a back-office from scratch for an iGaming Aggregator platform, responsible for providing single game aggregation interface for game operators in the industry, other important features as Jackpots engine, 3rd party integrations.
- As senior frontend in charge, all frontend development was supervised and guided by me, this involved creating a solid frontend project that will be nominated to be used as bootstrap project for other frontend products across the company.
- Development mentorship, I was in charge of guiding other developers to contribute to the project, this involved communication skills, understanding each member's high and lows, strategy tasks based on the team I have, lead by example, meeting to share knowledge, evaluate how I can get the most from the team I have.
- Participate actively in all areas of the product, Domain Crafting, Database Standards, Golang project architecture, Keycloak specialist in the team, go lang code.
- Project stack: React, NextJS, Shadcn, react-query, react-table, react-hook-form, zod.
- Project stats: A score on SonnarQube Analisis, 80% test coverage, low regression tickets.

Business Shop A&A
Tech Lead

Remote
Jun 2023 – May 2024

- Architecture Design for a CEX cryptocurrency platform, BSPay.
- Create an own multi-currency on-chain transactions module with support for major Blockchain Networks: Bitcoin, EVM compatible chains, TRON network.
- Create own ledger module for handling platform wallets and transactions.
- Create a mobile app for end users with realtime currency price updates, notifications, KYC integrations, user flows for deposit, swap, transfer and withdrawals, create a savings module.
- Lead and coordinate development teams of different areas: backend, app mobile, backoffice, landing pages.

ADV Integradores y Consultores S.A. de C.V. (ADV IC)
Full Stack Developer

Remote
Feb 2020 – Jun 2023

- Create a company own Ticket System with integration with internal tools for data reporting, co-relations, and data analysis, and integration with GLPI system.
- Maintain internal node based software and tools of the company.
- Implement node base solutions for clients of the company.
- Automate project deployment workflows for GitLab, custom Runners.

- Create an Android Messaging App, main features: Secure communications (own cryptography algorithm), Video and Audio Calls (WebRTC+custom implementation for integrating custom encryption algorithm), Vault for storing the files in the phone encrypted, Steganography. This App follows Android Clean Architecture.
- Create a Desktop Messaging App, main features: Secure communications (own cryptography algorithm), Video and Audio Calls (WebRTC+custom implementation for integrating custom encryption algorithm), Vault for storing the files in the phone encrypted, Steganography, this desktop app was made with Electron and an node addon extension written in C++.
- Create the frontend of a platform for one of the most important banks in Venezuela (Banco de Venezuela), this platform was an internal tool for managing employees medical insurance that the bank has for their employees and their families, this was a large platform due to the strict complaints constraint dedicated by statal regulators entities.

Leadership & Activities

In my experience as a software developer across these +9 years, I had the opportunity to apply for roles where I had to lead and guide other people as well as playing an important role for the product in the decision making.

Each product is unique, and so, each team, member, company, client, and other contexts, being a leader is in reality a result of the perception of other people, I cannot label myself as “leader”, if no one wants to follow me, being a leader means to inspire others and earn the respect of other people. Therefore I want to highlight some of things that I have done when I was in this position, it will be under your own perspective if it makes sense for a “leader”:

- **Understand the Domain**, following the Domain Driven Design paradigm, there is not way to create software that adapts and reacts to the constantly changing requirements if there is not a deep connection between the Domain, the Code, and the Model, so as Developer I try to keep this interconnected and understand when it changes over time, Craft the domain from the domain experts and supervise the rest of the team the into the flow, not just finishing tickets. All development is about design, as a leader, it is important to make sure the team is aware of it.
- **Productivity**, productivity is a single word, but what it means for a team is very complex, as time goes on, I can say that role of a person who has person beneath it is not “how much the team can deliver” but “take the most of the team considering the team's highs and lows”.
- **Strategy decision making**, It would be amazing if we could have a single pattern or standards that defines how to create and develop software, but reality, is that a software development is constantly pushed by different conditions, e.g user requirements changes, domain model refinements, developer indisposition, changes in the delivery dates, all of these mean that we had to make strategic decisions and react to these changes in the conditions, unfortunately the result of these decisions cannot be evaluated immediately, but in long run, we can evaluate how all of these strategy decisions affect the output of the software.
- **Allow the team to support you**. Supporting your team is a good practice, but allowing your team to support you is way more effective, delegate complex tasks to your team mates and guide them on the process. This strategy increases team knowledge and direct interaction with the domain, by exposing them to propose solutions that will solve business needs.
- **Be polite, be respectful**, create an environment that allows each member to feel important, respected, and allow the vulnerabilities, this will allow you to increase the disposition of the team.
- **Do not become a bottle neck**, each team needs to move, even if you are not around, make sure the team is in control of the software and not a single person, as team lead you have the responsibility to guide the team, not becoming a bottle neck for product development, this must be carefully applied.
- **Push early, push often**, ensure you have a development workflow culture to make small improvements instead of long hidden progress, this allows the team to work together and incrementally make the product each day better.

Skills & Interests

Technical:

- Frontend
 - Typescript/Javascript.
 - React, NextJS.
 - React Query, React Table, Redux, Redux Toolkit.
 - Tailwind, ShadCN, Material UI.
- Backend
 - Golang.
 - NestJS (typescript).
- Database
 - PostgreSQL.
 - MongoDB.
- Mobile
 - React Native.
 - Android Development (Kotlin).
- Architecture Patterns
 - Layered Architecture
 - Hexagonal
 - MVC
 - MVVM
 - Atomic Design
- Others
 - AWS, Oracle Cloud.
 - Docker, Docker compose.
 - Keycloak.
 - Supabase.
 - ElectronJS.
 - Vite/NuxtJS.

Language:

- English: B2
- Spanish: native.

Interests:

- Understanding low level concepts of the computers, it is not particularly related to hardware or software, can be both, e.g. how basic gates can be used for creating more complex components, I find this fascinating, or can be a heap implementation, or how call stack works.
- Chess: I like to play chess, I am quite good at it.
- Software Security, I find incredible how using a buffer overflow you can replace the return memory address of a function and gain remote code execution.
- Playing Soccer.
- Gym.
- Learn new languages.
